Python fastAPI Routes

GET   /home-page

GET/POST   / mcp-server-depending
on how python does it-

home-page(user enter query) →

llm(to refine the query for better
search results) →

MCP server(to do a search /
get back the results) →
synthesize and validate results.

home-page(desplays the results)

So everything is server-side rendered, meaning API-keys will be secured.
